Sprint 2 Review

The goal of this sprint was to implement basic image processing into our base application, specifically edge detection and augmenting images. This sprint was somewhat successful, as our team was able to update the application to detect a specific shape and modify the camera feed on top of it. However, while members worked on edge detection, issues with development tools slowed their progress.

Retrospective

Something that could be improved on for future work would be our team's definition of sprint goals. While each member had a good idea of the overall goal for this sprint, a better job could have been done splitting the sprint into tasks, and focusing more on ensuring that happens early in a sprint would improve our progress.
